Some basic aspects about our Universe

- Homogeneous, isotropic Universe described by FRW metric.
- Characterized by the scale factor a(t)
- Energy density, pressure etc depend on a(t)
- Radiation energy density $\rho_r \propto a^{-4}$
- Radiation temperature $T_r \propto a^{-1}$
- Most models a increases with t.
- Temperature of rediation high in the past and cools down with expansion.

Origin of the Cosmic Microwave Background Radiation

- Relic Radiation of an era when the temperature of the constituents of the Universe was very high and matter was ionized
- Ionized matter undergoes significant interaction/scattering with photons
- With expansion the Universe cools
- ▶ ions → neutral atoms → photons decouple

Probing Primordial Magnetic Fields with Cosmic Microwave Background Radiation

Department of Physics and Astrophysics University of Delh

◆□▶ ◆□▶ ◆ ≧▶ ◆ ≧▶ ● ⊇ ● のへぐ

Characteristic Features of the CMBR

- By-and-large preserves the information of the surface of last scatter.
- Small perturbations at the Surface of Last Scatter and later leave characteristic imprints on the CMBR
- Hence, CMBR could be a sensitive probe for the number of physical processes in the early universe.
- How well can CMBR probe the cosmic magnetic fields

Primordial Cosmic Magnetic Field - Why care ??

- \vec{B} over galactic scales $\sim \mu G$
 - μ Gauss \vec{B} observed in galaxies: both coherent & stochastic
 - ▶ \vec{B} growth via either dynamo amplification or flux freezing → a seed \vec{B} field is required
 - These seed fields may be of primordial origin
- Evidence for equally strong \vec{B} in high redshift ($z \sim 2$) [Bernet et al. 08. Kronberg et al. 08]
 - Enough time for dynamo to act?
- FERMI/LAT observations of γ-ray halos around AGN
 - **Detection** of intergalactic $\vec{B} \approx 10^{-15} G$

- [Ando & Kusenko 10]
- ► Lower limit: $\vec{B} \ge 3 \times 10^{-16}$ G on intergalactic \vec{B} [Neronov & Vovk, Science 10]

No compelling mechanism yet for origin of strong primordial \vec{B} fields [e.g. Martin & Yokoyama 08]

Cosmic Magnetic Fields - CMBR connection

1. Arising due to vortical velosity field (in the photon-baryon fluid) due to Lorentz force.

 \longrightarrow CMB Anisotropy spectrum

 \longrightarrow CMB Polarization spectrum

2. Arising from 3-point and 4-point correlation function of density and anisotropic stress tensor of magnetic field.

 \longrightarrow Induces Non-Gaussianity in CMB

Department of Physics and Astrophysics University of Delh

イロト イヨト イヨト イヨト

Question addressed

Can CMB Polarization power-spectrum, CMB anisotropy power-spectrum and the statistics of CMB anisotropy be used as a probe to study the Cosmic Magnetic Fields?

Aim of the talk:

To show that not only is this possibility, but it can be a very important probe.

T R Seshadri

Department of Physics and Astrophysics University of Dell

Nature of the Magnetic Field Considered

- 1. Magnetic Field: Stochastic. Statistically homogeneous and isotropic.
- 2. Assumed to be a Gaussian Random Field. Statistical properties specified completely by 2-point correlation function.
- Magnetic field → velocity field On scales > L_G (galactic scales) velocities small enough that the magnetic fields do not change.

$$\vec{B}(\vec{x},t) = \frac{\vec{b}_0(\vec{x})}{a^2(t)}$$

Department of Physics and Astrophysics University of Delh

R Seshadri

Statistical specification of the Magnetic Field

Field: Gaussian and spectrum specified by $\langle b_i(\vec{k})b_j^*(\vec{q})\rangle = (2\pi)^3 \delta(\vec{k} - \vec{q})P_{ij}(\vec{k})M(k)$ \rightarrow Completely determined by M(k)

 P_{ij} is the projection operator that ensures $\vec{
abla} \cdot \vec{b}_0 = 0$

$$\langle \vec{b}_0 \cdot \vec{b}_0 \rangle = 2 \int rac{dk}{k} \Delta_b^2(k)$$
 with $\Delta_b^2 = k^3 M(k)/2\pi^2$

Form of M(k): $M(k) \propto Ak^n$ with a cutoff at Alfen wave damping scale

Fixing A: In terms of variance, B_0 , of Magnetic Field at $k_G = 1 h \text{Mpc}^{-1}$

$$\Rightarrow \Delta_b^2(k) = \frac{B_0^2}{2}(n+3)\left(\frac{k}{k_g}\right)^{n+3}$$

Department of Physics and Astrophysics University of Delh

T R Seshadri

Effect of Magnetic Field on the Baryon-Photon Fluid

Action of magnetic field \longrightarrow Lorentz force on the baryon fluid. $\mathbf{F}_L = (\nabla \times \mathbf{B}_0) \times \mathbf{B}_0 / (4\pi a^5)$ \downarrow

Perturbations in the velocity field from Euler equations for the Baryon fluid

We consider scales > photon mean-free-path scales.

Viscosity effects due to the photons in diffusion approximation

$$\left(\frac{4}{3}\rho_{\gamma}+\rho_{b}\right)\frac{\partial \mathbf{v}_{b}^{B}}{\partial t}+\left[\frac{\rho_{b}}{a}\frac{da}{dt}+\frac{k^{2}\eta}{a^{2}}\right]\mathbf{v}_{i}^{B}=\frac{P_{ij}F_{j}}{4\pi a^{5}}.$$

Department of Physics and Astrophysics University of Dell

イロト イヨト イヨト イヨト

'Small' and 'Large' scale limits

$$\label{eq:Larger than Silk length scales} \begin{split} \frac{\text{Larger than Silk length scales}}{k \ll L_{\mathcal{S}}^{-1}} \\ \text{Damping due to photon diffusion is} \\ \text{negligible} \\ v_i^{\mathcal{B}} = G_i D, \\ \text{where } G_i = 3P_{ij}F_j/[16\pi\rho_0] \text{ and } \\ D = \tau/(1+S_*) \end{split}$$

 $\begin{array}{l} \frac{\text{Smaller than Silk length scales}}{k \gg L_{S}^{-1}} \\ \text{Diffusion damping significant} \\ \longrightarrow \text{terminal velocity} \\ \text{approximation} \\ v_{i}^{B} = G_{i}(\mathbf{k})D, \\ \text{where } D = (5/k^{2}L_{\gamma}) \end{array}$

Equating $v_i^{\mathcal{B}}$ in the two cases \downarrow Transition Scale $k_S \sim [5(1 + S_*)/(\tau L_{\gamma}(\tau))]^{1/2}$.

Department of Physics and Astrophysics University of Delh

ヘロト ヘアト ヘビト ヘビト

$$C_{I}^{BB} = 4\pi \frac{(I-1)(I+2)}{I(I+1)} \int_{0}^{\infty} \frac{k^{2} dk}{2\pi^{2}} \frac{I(I+1)}{2} \times \langle |\int_{0}^{\tau_{0}} d\tau g(\tau_{0},\tau)(\frac{kL_{\gamma}(\tau)}{3}) v_{B}(k,\tau) \times \frac{j_{I}(k(\tau_{0}-\tau))}{k(\tau_{0}-\tau)}|^{2} \rangle.$$
(1)

We approximate the visibility function as a Gaussian: $g(\tau_0, \tau) = (2\pi\sigma^2)^{-1/2} \exp[-(\tau - \tau_*)^2/(2\sigma^2)]$

 τ_* is the conformal epoch of "last scattering" σ measures the width of the LS.

$$\Delta T_P^{BB}(I) \equiv [I(I+1)C_I^{BB}/2\pi]^{1/2}T_0$$
, where $T_0 = 2.728$

Department of Physics and Astrophysics University of Dell

イロト イヨト イヨト イヨト

'Small' and 'Large' scale limits

Larger than Silk length scales $kL_s < 1$ and $k\sigma < 1$, the

$$\Delta T_{P}^{BB}(I) = T_{0}(\frac{\pi}{32})^{1/2} I(k) \frac{k^{2} L_{\gamma}(\tau_{*}) V_{A}^{2} \tau_{*}}{3(1+S_{*})} \approx 0.4 \mu K \left(\frac{B_{-9}}{3}\right)^{2} \left(\frac{l}{1000}\right)^{2} I(\frac{l}{R_{*}})^{2}$$

Smaller than Silk length scales $kL_S > 1$, $k\sigma > 1$ $kL_{\gamma}(\tau_*) < 1$

$$\Delta T_{P}^{BB}(I) = T_0 \frac{\pi^{1/4}}{\sqrt{32}} I(k) \frac{5V_A^2}{3(k\sigma)^{1/2}} \approx 1.2 \mu K \left(\frac{B_{-9}}{3}\right)^2 \left(\frac{I}{2000}\right)^{-1/2} I(\frac{I}{R_*}).$$

The mode-coupling integral, $(n \rightarrow -3, n > -3) l^2(k) = \frac{8}{3}(n+3)(\frac{k}{k_G})^{6+2n}$

ヘロン 人間 とくほど 人間 とう

= 990

Larger than Silk length scales and n = -2.9:

 $\Delta T_P^{BB}(I) \sim 0.16 \mu K (I/1000)^{2.1}$

Smaller than Silk length scales and n = -2.9:

 $\Delta T_P^{BB}(I) \sim 0.51 \mu K (I/2000)^{-0.4}$, Larger signals possible for n > -2.9 at the higher I end.

Results for different models

 $B_{-9} = 3$. Bold solid line is for a standard flat, Λ -dominated model, $(\Omega_{\Lambda} = 0.73, \Omega_m = 0.27, \Omega_b h^2 = 0.0224, h = 0.71$ n = -2.9). The long dashed curve n = -2.5, Short dashed curve $\Omega_b h^2 = 0.03$. The dotted curve : $\Omega_m = 1$ and $\Omega_{\Lambda} = 0$ n = -2.9.

Department of Physics and Astrophysics University of Delh

R Seshadri

The predicted anisotropy in temperature (dotted line), B-type polarization (solid line), E-type polarization (short dashed line) and T-E cross correlation (long dashed line) up to large $l \sim 5000$ for the standard A-CDM model, due to magnetic tangles with a nearly scale invariant spectrum.

Department of Physics and Astrophysics University of Delh

Why is CMB-Nongaussianty of special significance for studying Cosmic Magnetic Fields

Inflationary models:

Small fluctuations in the field (and hence, linear order)

Gaussian statistics for Fluctuation ↓ Gaussian statistics for CMB Temperature Anisotropy

CMB Non-gaussianity only from higher order effects

From Magnetic Fields:

Magnetic Stresses inherently quadratic in \vec{B} field \downarrow Even for Gaussianity \vec{B} field Magnetic stresses non-gaussian \downarrow Non-Gausianity in \vec{B} field induced CMB anisotropy

CMB Non-gaussianity even from lowest order orders

Department of Physics and Astrophysics University of Dell

Measures of Non-Gaussianity

What can we conclude from the Bispectrum Calculated above

- ► For $B_0 \sim 3$ nG, $l_1(l_1 + 1)l_2(l_2 + 1)l_3(l_3 + 1)b_{l_1l_2l_3} \sim 10^{-22}$ for a scale invarian magnetic field spectrum.
- This is a new probe of primordial magnetic fields. But only scalar modes included.
- ► Present limits on bispectrum →upper limits on B₀ ~ 35nG. Limits expected to improve significantly when vector and tensor modes also to be included.

Department of Physics and Astrophysics University of Dell

イロト イポト イヨト イヨト

Now Consider Scalar Anisotropic Stress from \vec{B}

Magnetic stress tensor

$$T_j^i(\mathbf{x}) = rac{1}{4\pi a^4} \left(rac{1}{2} b_0^2(\mathbf{x}) \delta_j^i - b_0^i(\mathbf{x}) b_{0j}(\mathbf{x})
ight)$$

in Fourier space

$$egin{aligned} S^i_j(\mathbf{k}) &= rac{1}{(2\pi)^3} \int b^i(\mathbf{q}) b_j(\mathbf{k}-\mathbf{q}) d^3 \mathbf{q} \ T^i_j(\mathbf{k}) &= rac{1}{4\pi a^4} \left(rac{1}{2} S^lpha_lpha(\mathbf{k}) \delta^i_j - S^i_j(\mathbf{k})
ight). \end{aligned}$$

• Magnetic perturbations to $T_i^i(\mathbf{k})$

$$T_j^i(\mathbf{k}) = p_{\gamma} \left(\Delta_B(\mathbf{k}) \delta_j^i + \Pi_{B_j^i}(\mathbf{k}) \right)$$

Department of Physics and Astrophysics University of Delh

< < >> < </p>

(2) > (4) 2

Scalar Anisotropic Stress \rightarrow Passive Mode

- Assume \vec{B} stresses small compared to total ρ , Π of photons + baryons
- linear perturbations
- scalar, vector, tensor evolve independently
- we focus on the scalar part of $\Pi_{B_j}^{i}$ as a source of CMB non-Gaussianity
- Scalar Anisotropic perturbations $\Pi_B(\mathbf{k})$ given by projection operator

$$\Pi_B(\mathbf{k}) = -\frac{3}{2} \left(\hat{k}_i \hat{k}_j - \frac{1}{3} \delta_{ij} \right) \Pi_B^{ij}$$

- Neutrinos: also develop scalar anisotropic stress after decoupling
- Prior to neutrino decoupling, $\Pi_B(\mathbf{k})$ only source
- After neutrino decoupling, Π_ν(k) also contributes with equal magnitude and opposite sign: rapid compensation [Lewis 04]

Magnetic anisotropic stress $\Pi_B(\mathbf{k})$ has effect only till neutrino decoupling

Department of Physics and Astrophysics University of Delh

Department of Physics and Astrophysics University of Di

T R Seshadri

Conclusions

- Cosmological magnetic fields (CMF) are an interesting possibility: CMB non-Gaussianity a unique probe of them
- CMF leaves characteristic imprints on the CMB both in the form of power-spectrum as well as Non-Gaussianity. We get much stronger B₀ upper limit from non-gaussianity in the anisotropic stress as compared to Power-spectrum.
- The trispectrum of anisotropic stress gives by far the most stringent limits. (0.7 nG)
