Plan of the talk

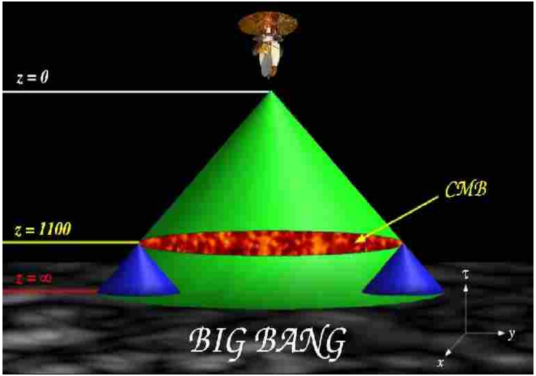
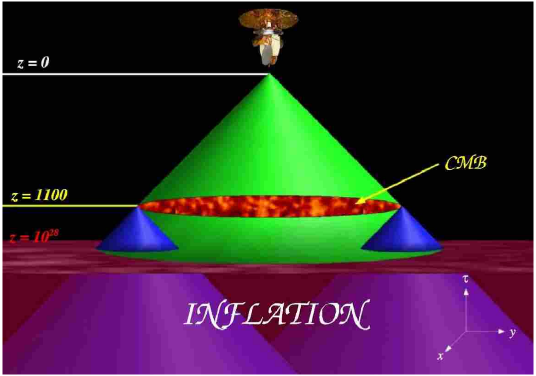
The resolution of the horizon problem in inflation

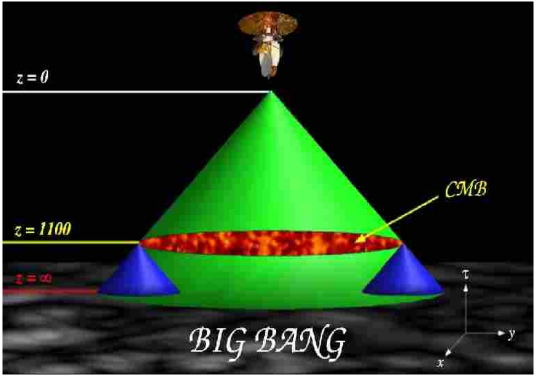


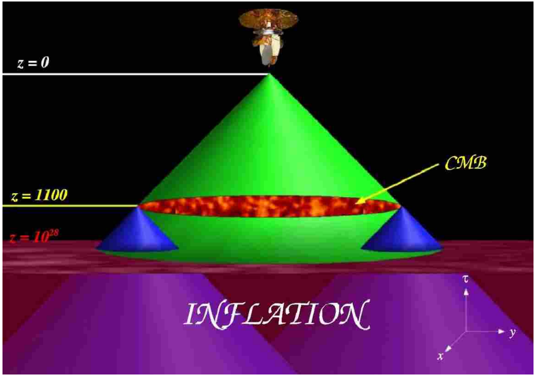


Left: The radiation from the CMB arriving at us from regions separated by more than the Hubble radius at the last scattering surface (which subtends an angle of about 1° today) could not have interacted before decoupling.

[1] Images from W. Kinney, astro-ph/0301448.

The resolution of the horizon problem in inflation



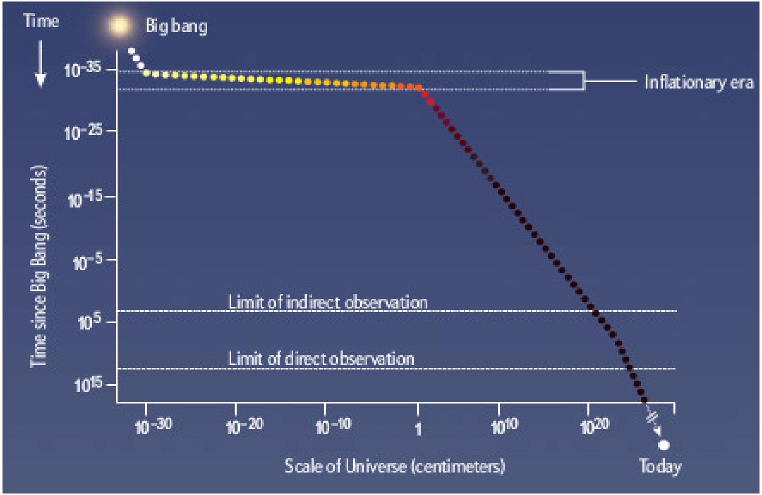


Left: The radiation from the CMB arriving at us from regions separated by more than the Hubble radius at the last scattering surface (which subtends an angle of about 1° today) could not have interacted before decoupling.

Right: An illustration of how an early and sufficiently long epoch of inflation helps in resolving the horizon problem[1].

[1] Images from W. Kinney, astro-ph/0301448.

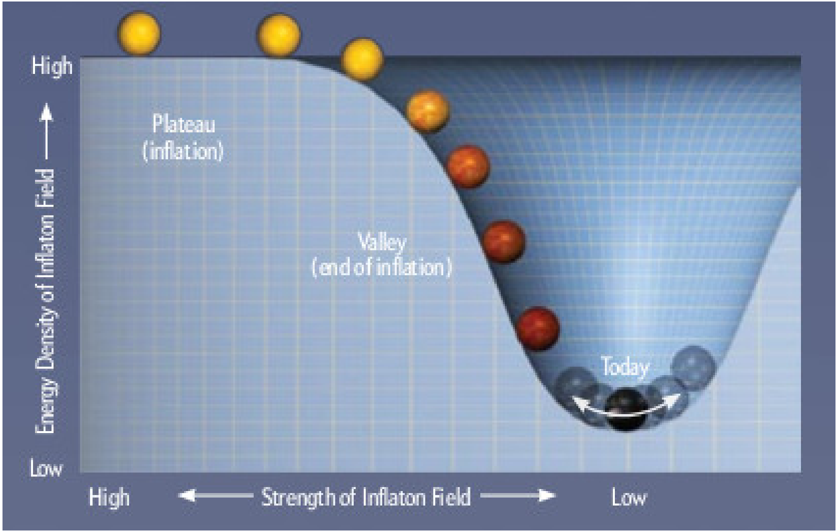
The time and duration of inflation



Inflation – a brief period of accelerated expansion – is expected to have taken place during the very early stages of the universe[2].

[2]Image from P. J. Steinhardt, Sci. Am. **304**, 18 (2011).

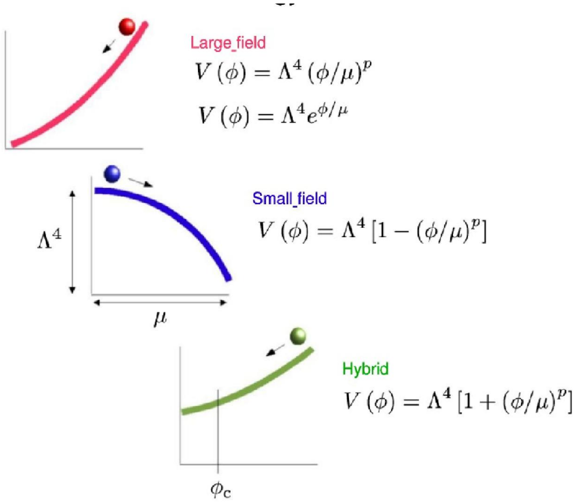
Driving inflation with scalar fields



Inflation can be achieved easily with scalar fields encountered in high energy physics[3].

[3] Image from P. J. Steinhardt, Sci. Am. **304**, 34 (2011).

A variety of potentials to choose from



A variety of scalar field potentials have been considered to drive inflation[4]. Often, these potentials are classified as small field, large field and hybrid models.

[4] Image from W. Kinney, astro-ph/0301448.

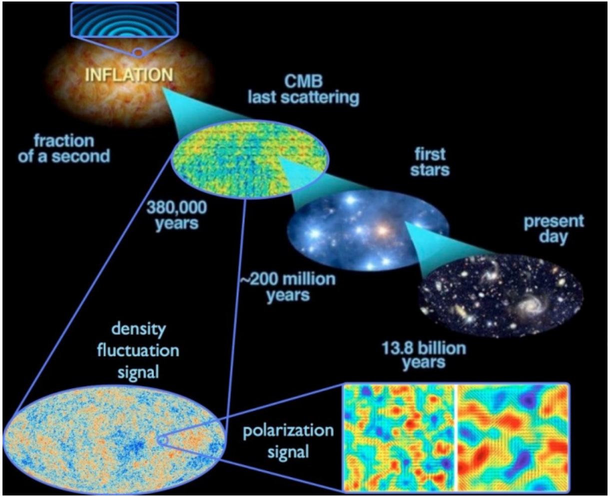
A partial list of inflationary models[5]. The goal is to rule out as many of the models as possible. Until either the cosmic neutrino background or the stochastic gravitational wave background is observed, it is the anisotropies in the CMB that provides the primary window to probe physics operating at the highest energy scales.

[5] From E. P. S. Shellard, *The future of cosmology: Observational and computational prospects*, in *The Future of Theoretical Physics and Cosmology*, Eds. G. W. Gibbons, E. P. S. Shellard and S. J. Rankin (Cambridge University Press, Cambridge, England, 2003).

Plan of the talk

Perturbations induced by quantum fluctuations



It is the quantum fluctuations associated with the scalar fields that generate the primordial perturbations which, in turn, induce the anisotropies in the CMB[6].

[6] From https://sciencesprings.wordpress.com/2016/04/29/from-ethan-siegel-the-biggest-question-about-the-beginning-of-the-universe/#jp-carousel-39872.

The slow roll scalar amplitude, index and running[7]

At the leading order in the slow roll approximation, the spectral amplitude of the curvature perturbation can be expressed in terms of the potential $V(\phi)$ as follows:

$$\mathcal{P}_{\mathrm{S}}(k) \simeq \frac{1}{12\,\pi^2\,M_{\mathrm{Pl}}^6}\,\left(\frac{V^3}{V_\phi^2}\right)_{k=a\,H},$$

with the subscript on the right hand side indicating that the quantity has to be evaluated when the modes leave the Hubble radius.

At the same order of the approximation, the scalar spectral index is given by

$$n_{\mathrm{S}} \equiv 1 + \left(\frac{\mathrm{d}\ln\mathcal{P}_{\mathrm{S}}}{\mathrm{d}\ln k}\right)_{k=a\,H} = 1 - 2\,\epsilon_1 - \epsilon_2\,,$$

while the running of the scalar spectral index can be evaluated to be

$$\alpha_{\mathrm{S}} \equiv \left(\frac{\mathrm{d}\,n_{\mathrm{S}}}{\mathrm{d}\ln k}\right)_{k=a\,H} = -\left(2\,\epsilon_1\,\epsilon_2 + \epsilon_2\,\epsilon_3\right)\,.$$

[7]See, for instance, B. A. Bassett, S. Tsujikawa and D. Wands, Rev. Mod. Phys. **78**, 537 (2006).

The tensor amplitude, spectral index and running

At the leading order in the slow roll approximation, the tensor amplitude is given by

$$\mathcal{P}_{_{\mathrm{T}}}(k) \simeq \frac{2}{3\,\pi^2}\,\left(\frac{V}{M_{_{\mathrm{Pl}}}^4}\right)_{k=a\,H},$$

while the spectral index and the running can be estimated to be[8]

$$n_{_{\mathrm{T}}} \equiv \left(\frac{\mathrm{d}\,\ln \mathcal{P}_{_{\mathrm{T}}}}{\mathrm{d}\ln k}\right)_{k=a\,H} = -2\,\epsilon_1 \quad \text{and} \quad \alpha_{_{\mathrm{T}}} \equiv \left(\frac{\mathrm{d}\,n_{_{\mathrm{T}}}}{\mathrm{d}\ln k}\right)_{k=a\,H} = -2\,\epsilon_1\,\epsilon_2.$$

The tensor-to-scalar ratio is then given by

$$r \equiv \frac{\mathcal{P}_{_{\mathrm{T}}}(k)}{\mathcal{P}_{_{\mathrm{S}}}(k)} \simeq 16\,\epsilon_1 = -8\,n_{_{\mathrm{T}}},$$

with the last equality often referred to as the consistency relation[9].

Plan of the talk

Definitions of scalar bispectrum and non-Gaussianity parameter

The scalar bispectrum $\mathcal{B}_{\mathcal{R}\mathcal{R}\mathcal{R}}(\boldsymbol{k}_1, \boldsymbol{k}_2, \boldsymbol{k}_3)$ is related to the three point correlation function of the Fourier modes of the curvature perturbation as follows[16]:

$$\langle \hat{\mathcal{R}}_{\boldsymbol{k}_1}(\eta_{\mathrm{e}})\, \hat{\mathcal{R}}_{\boldsymbol{k}_2}(\eta_{\mathrm{e}})\, \hat{\mathcal{R}}_{\boldsymbol{k}_3}(\eta_{\mathrm{e}}) \rangle = (2\,\pi)^3\ \mathcal{B}_{\mathcal{R}\mathcal{R}\mathcal{R}}(\boldsymbol{k}_1, \boldsymbol{k}_2, \boldsymbol{k}_3)\ \delta^{(3)}\,(\boldsymbol{k}_1 + \boldsymbol{k}_2 + \boldsymbol{k}_3)\,.$$

[16] D. Larson *et al.*, Astrophys. J. Suppl. **192**, 16 (2011);
E. Komatsu *et al.*, Astrophys. J. Suppl. **192**, 18 (2011).

[17] E. Komatsu and D. N. Spergel, Phys. Rev. D **63**, 063002 (2001).

[18] J. Martin and L. Sriramkumar, JCAP **1201**, 008 (2012).

Definitions of scalar bispectrum and non-Gaussianity parameter

The scalar bispectrum $\mathcal{B}_{\mathcal{R}\mathcal{R}\mathcal{R}}(\boldsymbol{k}_1, \boldsymbol{k}_2, \boldsymbol{k}_3)$ is related to the three point correlation function of the Fourier modes of the curvature perturbation as follows[16]:

$$\langle \hat{\mathcal{R}}_{\boldsymbol{k}_1}(\eta_{\mathrm{e}})\, \hat{\mathcal{R}}_{\boldsymbol{k}_2}(\eta_{\mathrm{e}})\, \hat{\mathcal{R}}_{\boldsymbol{k}_3}(\eta_{\mathrm{e}}) \rangle = (2\,\pi)^3\; \mathcal{B}_{\mathcal{R}\mathcal{R}\mathcal{R}}(\boldsymbol{k}_1, \boldsymbol{k}_2, \boldsymbol{k}_3)\; \delta^{(3)}\left(\boldsymbol{k}_1 + \boldsymbol{k}_2 + \boldsymbol{k}_3\right).$$

The observationally relevant non-Gaussianity parameter $f_{_{\mathrm{NL}}}$ is basically introduced through the relation[17]

$$\mathcal{R}(\eta, \boldsymbol{x}) = \mathcal{R}_{_{\mathrm{G}}}(\eta, \boldsymbol{x}) - \frac{3\, f_{_{\mathrm{NL}}}}{5}\; \left[\mathcal{R}_{_{\mathrm{G}}}^2(\eta, \boldsymbol{x}) - \langle \mathcal{R}_{_{\mathrm{G}}}^2(\eta, \boldsymbol{x}) \rangle\right],$$

where $\mathcal{R}_{_{\mathrm{G}}}$ denotes the Gaussian quantity. Utilizing the above relation and Wick's theorem, one can arrive at the following relation[18]:

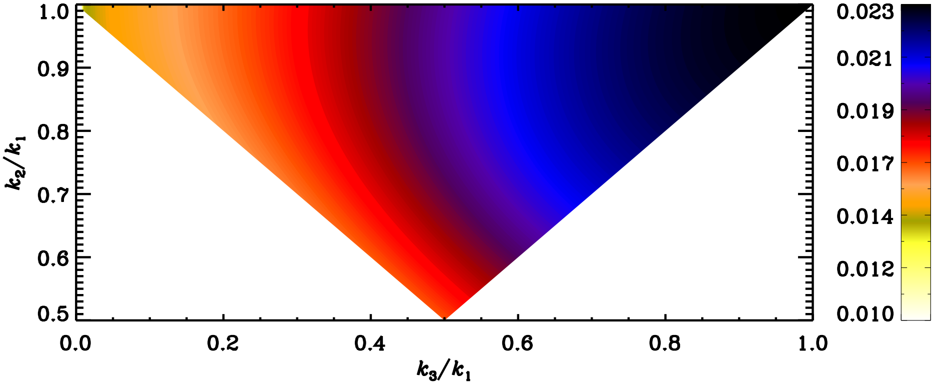
$$\begin{aligned} f_{_{\mathrm{NL}}}(\boldsymbol{k}_1, \boldsymbol{k}_2, \boldsymbol{k}_3) \quad &= \quad -\frac{10}{3}\,(2\,\pi)^{1/2}\;\left(k_1^3\, k_2^3\, k_3^3\right)\; \mathcal{B}_{\mathcal{R}\mathcal{R}\mathcal{R}}(\boldsymbol{k}_1, \boldsymbol{k}_2, \boldsymbol{k}_3) \\ &\quad \times \left[k_1^3\, \mathcal{P}_{_{\mathrm{S}}}(k_2)\, \mathcal{P}_{_{\mathrm{S}}}(k_3) + \mathrm{two~permutations}\right]^{-1}. \end{aligned}$$

[16] D. Larson *et al.*, Astrophys. J. Suppl. **192**, 16 (2011);
E. Komatsu *et al.*, Astrophys. J. Suppl. **192**, 18 (2011).

[17] E. Komatsu and D. N. Spergel, Phys. Rev. D **63**, 063002 (2001).

[18] J. Martin and L. Sriramkumar, JCAP **1201**, 008 (2012).

The shape of the slow roll bispectrum



The non-Gaussianity parameter $f_{\rm NL}$, evaluated in the slow roll approximation, has been plotted as a function of k_3/k_1 and k_2/k_1 for the case of the popular quadratic potential. Note that the non-Gaussianity parameter peaks in the equilateral limit wherein $k_1 = k_2 = k_3$. In slow roll scenarios involving the canonical scalar field, the largest value of $f_{\rm NL}$ is found to be of the order of the first slow roll parameter ϵ_1[19].

[19]Figure from D. K. Hazra, L. Sriramkumar and J. Martin, JCAP **1305**, 026, (2013).

Template bispectra

For comparison with the observations, the scalar bispectrum is often expressed in terms of the parameters $f_{\rm NL}^{\rm loc}$, $f_{\rm NL}^{\rm eq}$ and $f_{\rm NL}^{\rm orth}$ as follows:

$$G_{\mathcal{RRR}}(\boldsymbol{k}_1,\boldsymbol{k}_2,\boldsymbol{k}_3) = f_{\rm NL}^{\rm loc}\, G_{\mathcal{RRR}}^{\rm loc}(\boldsymbol{k}_1,\boldsymbol{k}_2,\boldsymbol{k}_3) + f_{\rm NL}^{\rm eq}\, G_{\mathcal{RRR}}^{\rm eq}(\boldsymbol{k}_1,\boldsymbol{k}_2,\boldsymbol{k}_3) + f_{\rm NL}^{\rm orth}\, G_{\mathcal{RRR}}^{\rm orth}(\boldsymbol{k}_1,\boldsymbol{k}_2,\boldsymbol{k}_3).$$

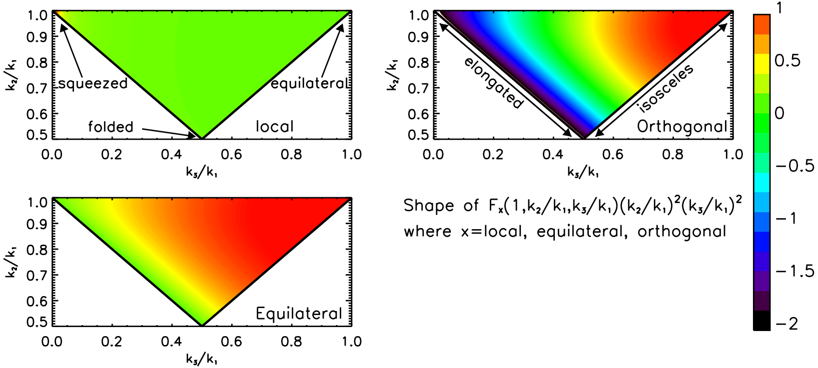


Illustration of the three template basis bispectra[20].

[20] E. Komatsu, Class. Quantum Grav. **27**, 124010 (2010).

Constraints on the scalar non-Gaussianity parameters

The constraints on the primordial values of the non-Gaussianity parameters from the Planck data are as follows[21]:

$$\begin{aligned} f_{\rm NL}^{\rm loc} &= 0.8 \pm 5.0, \\ f_{\rm NL}^{\rm eq} &= -4 \pm 43, \\ f_{\rm NL}^{\rm orth} &= -26 \pm 21. \end{aligned}$$

[21] Planck Collaboration (P. A. R. Ade *et al.*), Astron. Astrophys. **594**, A17 (2016).

Constraints on the scalar non-Gaussianity parameters

The constraints on the primordial values of the non-Gaussianity parameters from the Planck data are as follows[21]:

$$\begin{aligned} f_{\rm NL}^{\rm loc} &= 0.8 \pm 5.0, \\ f_{\rm NL}^{\rm eq} &= -4 \pm 43, \\ f_{\rm NL}^{\rm orth} &= -26 \pm 21. \end{aligned}$$

It should be stressed that these are constraints on the primordial values.

[21] Planck Collaboration (P. A. R. Ade *et al.*), Astron. Astrophys. **594**, A17 (2016).

Constraints on the scalar non-Gaussianity parameters

The constraints on the primordial values of the non-Gaussianity parameters from the Planck data are as follows[21]:

$$
\begin{aligned}
f_{\rm NL}^{\rm loc} &= 0.8 \pm 5.0,\\
f_{\rm NL}^{\rm eq} &= -4 \pm 43,\\
f_{\rm NL}^{\rm orth} &= -26 \pm 21.
\end{aligned}
$$

It should be stressed that these are constraints on the primordial values.

Also, the constraints on each of the $f_{\rm NL}$ parameters have been arrived at assuming that the other two parameters are zero.

[21] Planck Collaboration (P. A. R. Ade *et al.*), Astron. Astrophys. **594**, A17 (2016).

Constraints on the scalar non-Gaussianity parameters

The constraints on the primordial values of the non-Gaussianity parameters from the Planck data are as follows[21]:

$$\begin{aligned} f_{\rm NL}^{\rm loc} &= 0.8 \pm 5.0, \\ f_{\rm NL}^{\rm eq} &= -4 \pm 43, \\ f_{\rm NL}^{\rm orth} &= -26 \pm 21. \end{aligned}$$

It should be stressed that these are constraints on the primordial values.

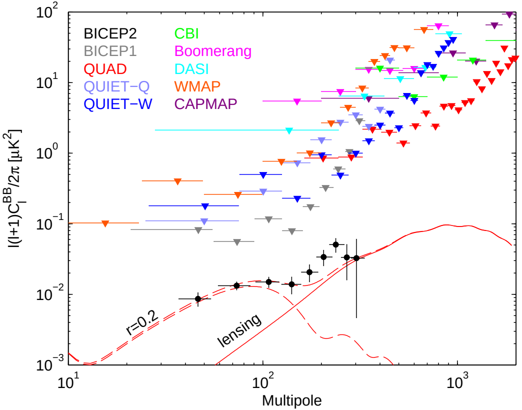
Also, the constraints on each of the $f_{\rm NL}$ parameters have been arrived at assuming that the other two parameters are zero.

These constraints imply that slowly rolling single field models involving the canonical scalar field which are favored by the data at the level of power spectra are also consistent with the data at the level of non-Gaussianities.

[21] Planck Collaboration (P. A. R. Ade *et al.*), Astron. Astrophys. **594**, A17 (2016).

Plan of the talk

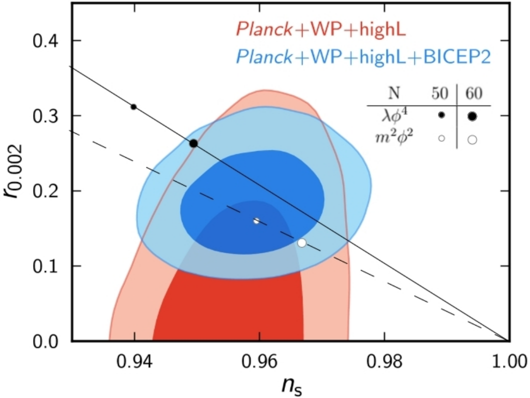
The ‘detection’ of the B-mode polarization by BICEP2



The supposed ‘detection’ of the angular power spectrum of the B-mode polarization of the CMB by BICEP2 as well as the limits that have been arrived at by the earlier efforts[22]. The BICEP2 observations, *viz.* the black dots with error bars, had seemed to be consistent with a tensor-to-scalar ratio of $r \simeq 0.2$.

[22] P. A. R. Ade *et al.*, arXiv:1403.3985 [astro-ph.CO].

Constraints from the BICEP2 data[23]



Joint constraints from the BICEP2 observations, the Planck data, the polarization data from WMAP as well as data for the high multipoles from SPT and ACT, on the inflationary parameters $n_{\rm s}$ and r.

[23] P. A. R. Ade *et al.*, arXiv:1403.3985 [astro-ph.CO].

Amazing prescience!

VOLUME 78, NUMBER 10 PHYSICAL REVIEW LETTERS 10 MARCH 1997

What Would We Learn by Detecting a Gravitational Wave Signal in the Cosmic Microwave Background Anisotropy?

David H. Lyth

School of Physics and Chemistry, Lancaster University, Lancaster LA1 4YB, United Kingdom

(Received 20 June 1996)

Inflation generates gravitational waves, which may be observable in the low multipoles of the cosmic microwave background anisotropy but only if the inflaton field variation is at least of order the Planck scale. Such a large variation would imply that the model of inflation cannot be part of an ordinary extension of the standard model, and combined with the detection of the waves it would also suggest that the inflaton field cannot be one of the superstring moduli. Another implication of observable gravitational waves would be a potential $V^{1/4} = 2$ to 4×10^{16} GeV , which is orders of magnitude bigger than the prediction of most models. [S0031-9007(97)02506-4]

PACS numbers: 98.80.Cq, 04.30.Db, 98.70.Vc

A paper by David Lyth with a title that had seemed amazingly apt in the light of BICEP2 observations.

The scale of inflation

During slow roll, if we ignore the weak scale dependence, we can write

$$r \simeq \frac{2\,V}{3\,\pi^2\,M_{_{\mathrm{Pl}}}^4}\,\frac{1}{\mathcal{A}_{_{\mathrm{S}}}},$$

where, recall that, $\mathcal{A}_{_{\mathrm{S}}}$ denotes the amplitude of the scalar perturbations.

The amplitude of the primordial scalar perturbations is usually quoted at the pivot scales of either 0.05 or $0.02\ \mathrm{Mpc}^{-1}$, which correspond to multipoles that lie in the Sachs-Wolfe plateau. This value for the scalar amplitude is often referred to as COBE normalization[24].

According to COBE normalization, $\mathcal{A}_{_{\mathrm{S}}} \simeq 2.14 \times 10^{-9}$, which implies that we can write

$$V^{1/4} \simeq 3.2 \times 10^{16}\, r^{1/4}\ \mathrm{GeV} \simeq 2.1 \times 10^{16}\ \mathrm{GeV},$$

with the final value being for the case wherein $r \simeq 0.2$.

Note that, if $H_{_{\mathrm{I}}}$ represents the Hubble scale during the inflationary epoch, as $H_{_{\mathrm{I}}}^2 \simeq V/(3\,M_{_{\mathrm{Pl}}}^2)$ during slow roll, the above relation also leads to

$$\frac{H_{_{\mathrm{I}}}}{M_{_{\mathrm{Pl}}}} \simeq 4.6 \times 10^{-5}.$$

[24] E. F. Bunn, A. R. Liddle and M. J. White, Phys. Rev. D **54**, R5917 (1996).

The Lyth bound

The contributions of the primordial gravitational waves to the B-mode of the CMB polarization angular power spectrum drops sharply after multipoles of $\ell \simeq 100$, roughly around the same multipoles where the TT angular power spectrum exhibits its first peak.

The CMB quadrupole, *i.e.* $\ell = 2$, corresponds to the largest cosmological scale of interest, *viz.* the Hubble radius H_0^{-1} today. Hence, we can relate the wavenumbers to the multipoles as $k \simeq H_0\,\ell/2$. Therefore, a Δl corresponds to the width $\Delta k \simeq H_0\,\Delta\ell/2$ in terms of wavenumbers.

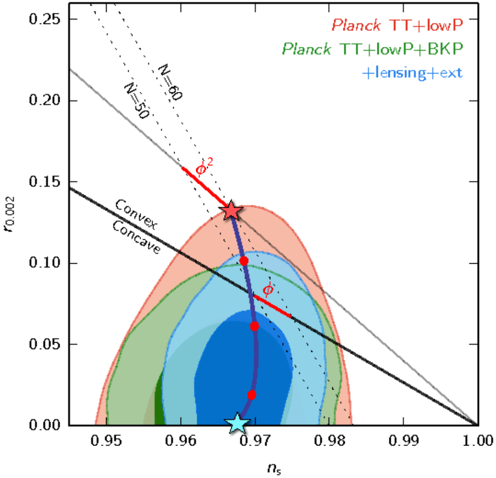
As $a \propto \mathrm{e}^N$, the modes over a domain Δk corresponding to $\Delta l \simeq 100$ will leave the Hubble radius during inflation over the time period $\Delta N \simeq \log 10 \simeq 3.9$. During slow roll, we have $H^2 = V/(3\,M_{_{\rm Pl}}^2)$ and $3\,H\,\dot{\phi} \simeq V_\phi$, so that[25]

$$\Delta\phi \simeq (r/8)^{1/2}\,\Delta N\;M_{_{\rm Pl}} \simeq 0.6\,M_{_{\rm Pl}},$$

with the final value corresponding to $r \simeq 0.2$.

[25] D. H. Lyth, Phys. Rev. Letts. **78**, 1861 (1997).

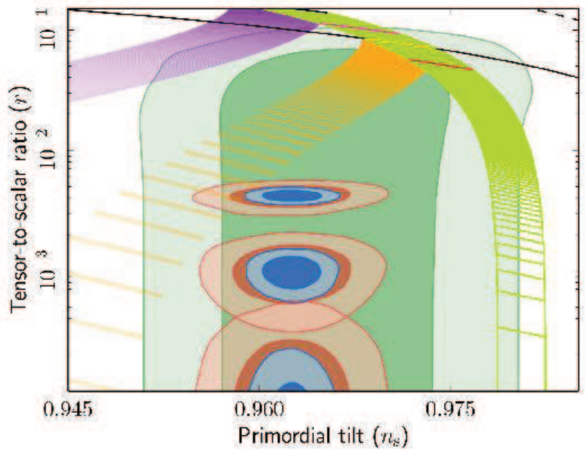
Models with small tensor-to-scalar ratio



The theorists are ahead! The so-called alpha-attractor models which can lead to rather small values of the tensor-to-scalar ratio[26].

[26] R. Kallosh and A. Linde, Phys. Rev. D **91**, 083528 (2015).

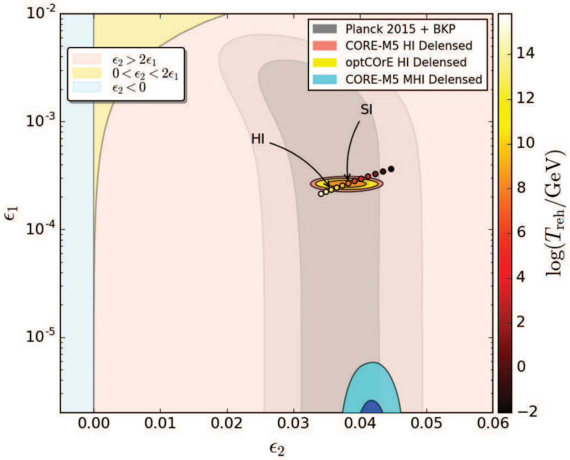
The n_s-r-plane with CORE



Marginalized forecasts for CORE[27]. The small blue contours illustrate what a CORE detection would look like if $r \simeq 0.0042$ (as in the Starobinsky model), $r \simeq 0.001$ or when the tensors are undetectably small. The red contours correspond to forecasts for LITEBIRD.

[27] F. Finelli *et al.*, arXiv:1612.08270 [astro-ph.CO].

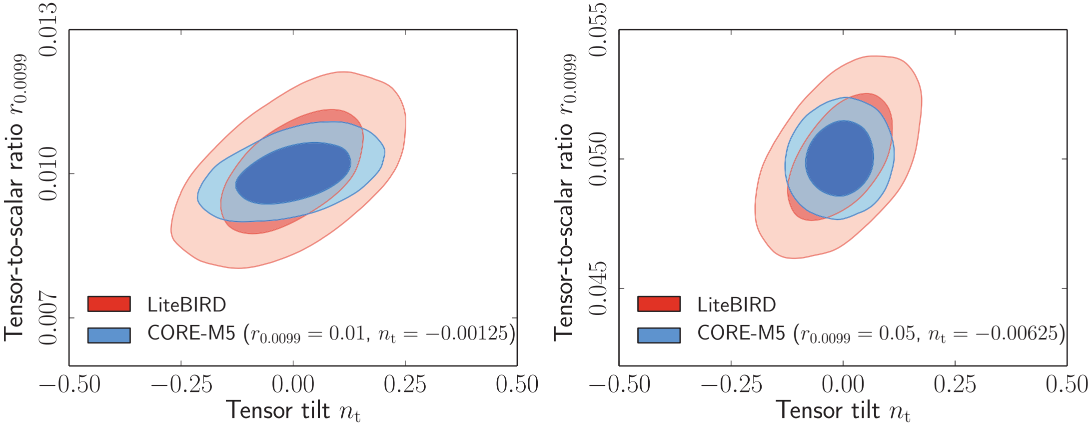
Discriminating between different post-inflationary dynamics



Marginalized forecasts for CORE[28]. CORE can, in principle, distinguish between Higgs inflation (HI) and Starobinsky inflation (SI), which share the same inflationary potential, but have different reheating temperatures (around $10^{12}\,\mathrm{GeV}$ for HI and $10^{8}\,\mathrm{GeV}$ for SI).

[28] F. Finelli *et al.*, arXiv:1612.08270 [astro-ph.CO].

CORE forecasts for the slow roll consistency relation

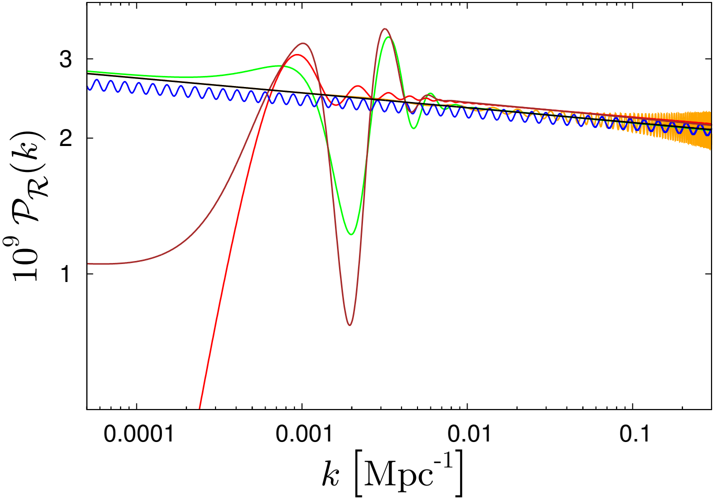


Marginalized forecasts for the slow roll consistency relation corresponding to two different values of the tensor-to-scalar ratio [29]. Deviations from the consistency relation would imply inflation driven by multiple fields.

[29] F. Finelli *et al.*, arXiv:1612.08270 [astro-ph.CO].

Plan of the talk

Power spectra with features



Primordial power spectra with features that lead to an improved fit to the data than the conventional, nearly scale, invariant spectra[30].

[30] Planck Collaboration (P. A. R. Ade *et al.*), Astron. Astrophys. **594**, A20 (2016).

Inflationary models permitting deviations from slow roll

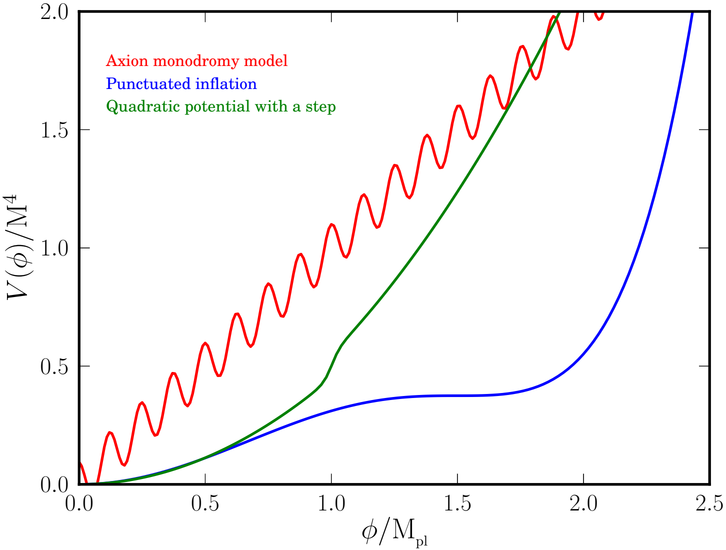


Illustration of potentials that admit departures from slow roll.

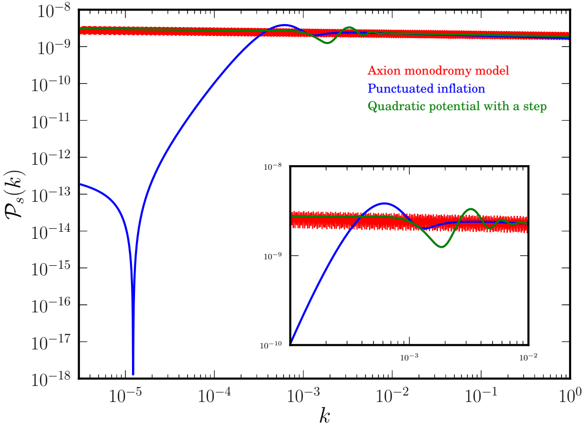
Spectra leading to an improved fit to the CMB data



The scalar power spectra in different inflationary models that lead to a better fit to the CMB data than the conventional power law spectrum[31].

- IUCAA – Constructing viable models of inflation, features in the primordial spectrum and comparison of models with the data, deviations from statistical isotropy, Generation of primordial magnetic fields
- IIT Mumbai, TIFR – Models of inflation motivated by string theory and modified gravity, characterizing non-Gaussianities, quantum-to-classical transition of primordial perturbations
- ISI Kolkata, SINP – Models of inflationary motivated by string theory, effective field theories of inflation

Expertise in India II

- PRL – Models of inflation involving modified gravity and non-minimal coupling, imprints of pre-inflationary dynamics, comparison of models with the data
- HRI – Models of inflationary models motivated by string theory
- IIT Kanpur – Models of inflation, Deviations from statistical isotropy, quantum-to-classical transition of primordial perturbations
- Jamia Milia Islamia, University of Delhi – Non-canonical models of inflation, generation of primordial magnetic fields

Plan of the talk

Summary

- A nearly scale invariant primordial spectrum as is generated in slow roll inflation is remarkably consistent with the cosmological data.

[34] J. Martin, C. Ringeval and V. Vennin, Phys. Dark Univ. **5–6**, 75 (2014).

[35] J. R. Fergusson, H. F. Gruetjen, E. P. S. Shellard and M. Liguori, Phys. Rev. D **91**, 023502 (2015).

Summary

- A nearly scale invariant primordial spectrum as is generated in slow roll inflation is remarkably consistent with the cosmological data.
- The strong constraints on the scalar non-Gaussianity parameter seem to further support slow roll models of inflation.

[34] J. Martin, C. Ringeval and V. Vennin, Phys. Dark Univ. **5–6**, 75 (2014).

[35] J. R. Fergusson, H. F. Gruetjen, E. P. S. Shellard and M. Liguori, Phys. Rev. D **91**, 023502 (2015).

Summary

- A nearly scale invariant primordial spectrum as is generated in slow roll inflation is remarkably consistent with the cosmological data.
- The strong constraints on the scalar non-Gaussianity parameter seem to further support slow roll models of inflation.
- However, there exist some anomalies (features in the power spectra, hemispherical asymmetry, etc.), which, in principle, can provide us with clues to physics operating at the highest energies.

[34] J. Martin, C. Ringeval and V. Vennin, Phys. Dark Univ. **5–6**, 75 (2014).

[35] J. R. Fergusson, H. F. Gruetjen, E. P. S. Shellard and M. Liguori, Phys. Rev. D **91**, 023502 (2015).

Summary

- A nearly scale invariant primordial spectrum as is generated in slow roll inflation is remarkably consistent with the cosmological data.
- The strong constraints on the scalar non-Gaussianity parameter seem to further support slow roll models of inflation.
- However, there exist some anomalies (features in the power spectra, hemispherical asymmetry, etc.), which, in principle, can provide us with clues to physics operating at the highest energies.
- It is important that a systematic search involving the scalar and the tensor power spectra[34], the scalar and the tensor bispectra and the cross correlations is carried to arrive at a smallest possible subset of viable inflationary models[35]. Further, precise observations of the CMB anisotropies can play a significant role towards this effort.
